Perhitungan ΣF :

1. *Sudden contraction losses (h_c)*

$$K_c = 0,55 \times \left(1 - \frac{A_2}{A_1} \right)$$

di mana: A₁ = luas penampang tangki

A₂ = luas penampang pipa

Karena A₁>>>A₂ maka (A₂/A₁) diabaikan.

$$K_c = 0,55 \times (1-0) = 0,55$$

$$h_c = K_c \times \left(\frac{v^2}{2 \times \alpha \times g_c} \right)$$

$$= 0,55 \times \left(\frac{3,34^2}{2 \times 1 \times 32,174} \right)$$

$$= 0,09 \text{ ft.lb}_f/\text{lb}_m$$

2. Friksi pada pipa lurus (F_f)

Digunakan pipa *commercial steel*, $\varepsilon = 0,00015 \text{ ft}$

$$\frac{\varepsilon}{D} = \frac{0,00015}{0,51} = 0,0003$$

Dari figure 2.10-3 Geankoplis ed. 3 [20], diperoleh f = 0,006

Diasumsikan: panjang pipa lurus (ΔL) = 15 ft

$$F_f = 4 \times f \times \frac{\Delta L}{D} \times \frac{v^2}{2 \times g_c}$$

$$= 4 \times 0,006 \times \frac{15}{0,51} \times \frac{3,34^2}{2 \times 32,174}$$

Suhu bahan mula-mula = 30°C = 86°F

Suhu bahan keluar = 80°C = 176 °F

Suhu steam = 148°C = 298,4 °F

$$A = \frac{Q}{U(T_s - T)} \quad [22, \text{ halaman } 470]$$

dengan: - A : Luas perpindahan panas, ft²

- Q : Panas yang ditransfer oleh steam, Btu/jam = 5.207.752,97 Btu/jam

- T_s : Temperatur steam, °F = 298,4°F

- T : Temperatur feed, °F = 86°F

- U : Overall coefficient heat transfer = 200 Btu/h.ft².°F [17, halaman 601]

$$A = \frac{5.207.752,97}{200(298,4 - 86)}$$

$$= 122,59 \text{ ft}^2$$

Dari Kern [27] halaman 404 didapatkan:

Diameter tube (OD) = 1¹/₄ – 2 in

Panjang tube (L) = 12-24 ft

Diambil diameter tube = 1,32 in dan panjang tube = 12 ft.

Dari tabel 11 halaman 844, Kern [27] didapatkan:

Ukuran pipa nominal, IPS = 1 in, sch 40, ID = 1,049 in

$$a_t = 0,344 \text{ ft}^2/\text{ft}$$

$$A = Nt.a_t.L$$

$$Nt = 29,69 \sim 30 \text{ buah}$$

Dari tabel 4-7 halaman 94, Ulrich [18]:

Diameter evaporator = 4 m = 13,12 ft

Tinggi evaporator = 8 m = 26,25 ft

$$\rho_{camp} = 0,97 \text{ kg/L} = 60,46 \text{ lb/ft}^3$$

$$\text{Tekanan hidrostatik maksimal} = \frac{\rho \times H}{144}$$

$$= \frac{60,46 \times 26,25}{144}$$

$$F = 13400 \text{ psia}$$

$$E = 0,85 \text{ (single welded butt joint)}$$

$$C = 1/8 \text{ in} = 0,125 \text{ in}$$

$$r_i = 6,5615 \text{ ft} = 78,738 \text{ in}$$

Tebal shell

$$ts = \frac{P \cdot ri}{f \cdot E - 0,6P} + C$$

$$ts = \frac{13,23.78,738}{13400.0,85 - 0,6.13,23} + \frac{1}{8} \text{ in}$$

$$ts = 0,22 = 5/16 \text{ in}$$

Menghitung tebal head (dished head)

$$\text{Tebal dished} = \frac{0,885.P.Rc}{f.E - 0,1P} + C [15, \text{ persamaan 13-12}]$$

di mana $Rc = ID = 13,123 \text{ ft} = 157,476 \text{ in}$

$$t = \frac{0,885.13,23.157,476}{13400.0,85 - 0,1.13,23} + 0,125$$

$$= 0,29 \text{ in} \sim 5/16 \text{ in}$$

Dari tabel 5.6 Brownell [15], untuk tebal *dished* = 5/16 in, $sf = 1,5 - 3$ in, $icr = 1^5/16 \text{ in} = 21/16 \text{ in}$

Diambil $sf = 2 \frac{1}{2} \text{ in} = 0,0635 \text{ m}$

$BC = r - icr$ [15, halaman 87]

$$= 78,738 - 21/16 \text{ in}$$

$$= 77,4255 \text{ in} = 6,4521 \text{ ft} = 1,97 \text{ m}$$

$a = ID/2 = 157,476/2$

$$= 78,738 \text{ in} = 6,56 \text{ ft} = 2,00 \text{ m}$$

$AB = a - icr = 2,00 - 1,3125 = 0,69 \text{ m}$

$$b = r - \sqrt{BC^2 - AB^2}$$

$$= 2 - \sqrt{1,97^2 - 0,69^2}$$

$$= 0,15 \text{ m}$$

$$OA = t + b + sf = 7,37 \times 10^{-3} + 0,15 + 0,0635 = 0,22 \text{ m}$$

$$OD = ID + 2.t = 4 + 2.7,37 \times 10^{-3} = 4,02 \text{ m}$$

21. Barometric Condenser

Fungsi : Mengembunkan uap dari evaporator

Tipe : Counter Current Condenser

Dasar pemilihan : Operasinya mudah

Perhitungan:

Laju massa uap masuk = 12.847,24 kg/batch = 8156,98 lb/jam

Suhu uap masuk = 64,4°C = 148°F

Suhu air pendingin = 30°C = 86°F

Catatan [24, hal 211]:

Noncondensable gas tidak melebihi 1% dari total uap air yang akan dikondensasi. Jadi laju uap yang akan dikondensasi = $0,99 \times 8156,98 \text{ lb/jam} = 8075,41 \text{ lb/jam}$.

Noncondensable gas = $8156,98 - 8075,41 = 81,57 \text{ lb/jam}$

Temperatur uap jenuh pada 4,5 bara = 148°C = 298,4°F

Terminal difference = 5°F

Temperatur air keluar *barometric condenser* = $298,4 - 5 = 293,4 \text{ °F}$

Temperatur air masuk = 86°F

Kenaikan suhu air = $293,4 - 86 = 207,4 \text{ °F}$

Temperatur udara (*noncondensable gas*) meninggalkan *barometric condenser*
= $86 + 5 = 91 \text{ °F}$

Dari Perry [24] halaman 211, persamaan 6.8:

Gpm air pendingin yang dibutuhkan:

$$\text{Gpm} = \frac{W_s \times L}{T_w \times 500}$$

di mana : Ws = jumlah uap yang dikondensasi (lb)

L = panas latent penguapan pada $T_{\text{sat}} = 148 \text{ °C} = 2.120,448 \text{ kJ/kg} = 4466,20 \text{ Btu/lb}$

$$\text{Gpm} = \frac{8075,41 \times 4466,20}{207,4 \times 500} = 347,80$$

Tinggi barometric condenser

P_a = tekanan pada permukaan liquid dalam kaki barometer

P_b = tekanan pada permukaan liquid

P_h = tekanan hidrostatis

$$P_a = P_b$$

$$P_h + P_a = P_b$$

$$\rho_{air} \cdot h_{air} \cdot g + 45 = 101,325$$

$$h_{air} = (101,325 - 45) / 1,9,80665 = 5,74 \text{ m}$$

Pada keadaan ideal : $P_a = 0$

Spesifikasi Alat:

Volume air = 80% volume *hot well*

Volume *hot well* = $0,51 / 0,8 = 0,64 \text{ m}^3 \approx 1 \text{ m}^3$

Bentuk : persegi

Ukuran : panjang = 1 m ; lebar = 1 m ; tinggi = 1 m

Spesifikasi Alat:

Fungsi : Untuk menampung kondensasi dari *barometric condenser*

Volume : 1 m^3

Bentuk : persegi

23. Steam Jet Ejector

Fungsi : Untuk memvakumkan evaporator

Tipe : *Single stage steam ejector*

Jadi, kebutuhan steam = $1,5 \times 81,57 = 122,36$ lb/jam

5. Berdasarkan Coulson & Richardson [28] dipilih plat jenis HF dengan *Projected Area* = $A_p = 0,36 \text{ m}^2$ dan *Developed Area* = $A_d = 0,43 \text{ m}^2$

$$HPCD = 0,18 \text{ m}$$

$$VPCD = 0,72 \text{ m}$$

$$\varphi = A_d / A_p = 0,43 / 0,36 = 1,1944$$

Jumlah plat untuk perpindahan panas (n):

$$n = A / A_d = 2,87 / 0,43 = 6,67 \text{ buah}$$

$$U_d = 1.463.510 / (85 \cdot 0,43 \cdot 68) = 588,84 \text{ W/m}^2\text{K}$$

$$n = n_{ch} + n_{cc} - 1$$

dengan n_{ch} = jumlah *channel* untuk fluida panas

n_{cc} = jumlah *channel* untuk fluida dingin

$$n_{ch} + n_{cc} = n + 1 = 141 + 1 = 142 \rightarrow n_{ch} = n_{cc} = 71 \text{ buah}$$

$$L = 0,36 / 0,27 = 1,33 \text{ m}$$

$$1,2 \times 5,73 \text{ ft}^3 = \frac{\pi}{4} \times 1,5 \times ID^3 \times \left(\frac{1 \text{ ft}}{12 \text{ in}} \right)^3 + 2 \times 0,000049 \times D^3$$

$$6,88 \text{ ft}^3 = 6,81 \times 10^{-4} \times ID^3 + 9,8 \times 10^{-5} \times D^3$$

$$6,88 \text{ ft}^3 = 7,79 \times 10^{-4} \times ID^3$$

$$ID = 20,67 \text{ in} = 1,72 \text{ ft}$$

$$H_s = 1,5 \times ID$$

$$= 1,5 \times 1,72$$

$$= 2,58 \text{ ft}$$

$$\text{Volume liquid dalam } dish = 0,000049 \times ID^3$$

$$= 0,000049 \times 1,72^3$$

$$= 2,49 \times 10^{-4} \text{ ft}^3$$

$$\begin{aligned} \text{Tinggi cairan dalam shell} &= \frac{\text{volume liquid} - \text{volume dish}}{\frac{\pi}{4} \times ID^2} \\ &= \frac{6,88 - 2,49 \times 10^{-4}}{\frac{\pi}{4} \times 1,72^2} \\ &= 2,96 \text{ ft} \end{aligned}$$

$$\begin{aligned} P_{\text{operasi}} = P_{\text{hidrostatis}} &= \frac{\rho \times H}{144} \\ &= \frac{49,86 \times 2,96}{144} \\ &= 1,03 \text{ psig} \end{aligned}$$

Bahan konstruksi Steel SA-240, Grade A

$f = 16.250 \text{ psi}$ [15, App. D halaman 342]

$E = 0,8$ [15, tabel 13.2]

$C = \text{corrosion allowance} = \frac{1}{8} \text{ in}$

Tebal shell:

$$\begin{aligned} ts &= \frac{P \times ID}{2 \times (f \times E - 0,6 \times P)} + C \\ &= \frac{1,33 \times 20,67}{2 \times (16.250 \times 0,8 - 0,6 \times 1,33)} + \frac{1}{8} \\ &= 0,13 \text{ in} \approx \frac{3}{16} \text{ in} \end{aligned}$$

Tebal dish (dished head):

$$ts = \frac{3}{16} \text{ in}$$

$$OD = ID + 2 \times ts$$

$$= 20,67 + 2 \times \frac{3}{16}$$

$$= 21,05 \text{ in}$$

Dari Brownell & Young [15] Tabel 5.7 diperoleh:

$$OD \text{ standar} = 22 \text{ in}$$

$$icr = 1\frac{1}{4} \text{ in}$$

$$rc = 20 \text{ in}$$

$$W = \frac{1}{4} \times \left(3 + \sqrt{\frac{rc}{icr}} \right) [15, \text{ persamaan 7.76, halaman 138}]$$

$$= \frac{1}{4} \times \left(3 + \sqrt{\frac{20}{1\frac{1}{4}}} \right)$$

$$= 1,75 \text{ in}$$

$$a = \frac{ID}{2}$$

$$= \frac{20,67}{2}$$

$$= 10,34 \text{ in}$$

$$AB = \frac{ID}{2} - icr$$

$$= \frac{20,67}{2} - 1\frac{1}{4}$$

$$= 9,09 \text{ in}$$

$$BC = r - icr$$

$$= 20 - 1\frac{1}{4}$$

$$= 18,75 \text{ in}$$

$$b = r - \sqrt{(BC)^2 - (AB)^2}$$

$$= 20 - \sqrt{(18,75)^2 - (9,09)^2}$$

$$= 3,6$$

$$td = \frac{P \times rc \cdot W}{2 \times f \times E - 0,2 \times P} + C \quad [15, \text{ persamaan 7.77}]$$

$$= \frac{1,33 \times 20 - 1,75}{2 \times 16.250 \times 0,8 - 0,2 \times 1,33} + \frac{1}{8}$$

$$= 0,13 \approx \frac{3}{16} \text{ in}$$

$$\text{Tebal dish standar} = \frac{3}{16} \text{ in} \quad [15, \text{ tabel 5.7}]$$

$$\text{Dipilih panjang straight-flange (sf)} = 2 \text{ in} \quad [15, \text{ tabel 5.8}]$$

$$OA = t + b + sf$$

$$= \frac{3}{16} + 3,6 + 2$$

$$= 5,79 \text{ in} = 0,48 \text{ ft}$$

$$\text{Tinggi tangki keseluruhan} = \text{tinggi shell} + (2 \times \text{tinggi dish})$$
