

## **BAB 7**

### **SIMPULAN DAN SARAN**

#### **7.1 Kesimpulan**

Berdasarkan penelitian perbedaan kadar hemoglobin terglikasi (HbA1c) pada pasien kusta dan non kusta di dua fasilitas kesehatan Jawa Timur yaitu di RSUD Sumberglagah dan Puskesmas Bangkalan pada 36 responden penelitian yang dilaksanakan pada tanggal 9 September – 30 Oktober 2023, dapat disimpulkan sebagai berikut:

1. Berdasarkan karakteristik usia responden, baik pada responden pasien kusta dan non kusta didapatkan hasil mayoritas pada usia 26-35 tahun.
2. Berdasarkan karakteristik jenis kelamin, baik pada responden pasien kusta dan non kusta

didapatkan hasilnya mayoritas pada kelompok berjenis kelamin laki-laki

3. Berdasarkan uji statistik menggunakan uji *Mann-Whitney*, didapatkan hasil  $P=0,375$  ( $P>0,05$ ) yang menunjukkan bahwa tidak terdapat perbedaan kadar hemoglobin terglikasi (HbA1c) pada pasien kusta dan non kusta di dua fasilitas kesehatan Jawa Timur. Pada penelitian ini, pasien kusta dan non kusta mayoritas memiliki kadar HbA1c normal (<5,7%).

## 7.2 Saran

### 7.2.1 Bagi Responden

Dengan dilakukannya penelitian ini, diharapkan responden pasien kusta maupun non kusta dapat lebih memperhatikan keadaan kadar gula darah dan dapat

melakukan kontrol gula darah melalui pemeriksaan HbA1c.

### **7.2.2 Bagi Peneliti Selanjutnya**

Dengan dilakukannya penelitian ini, diharapkan bagi peneliti selanjutnya dapat menambahkan jumlah sampel yang lebih besar dari penelitian ini serta memperhatikan faktor-faktor lainnya yang dapat mempengaruhi kadar hemoglobin terglikasi (HbA1c)

### **7.2.3 Bagi Universitas Katolik Widya Mandala Surabaya**

Dengan dilakukannya penelitian ini, diharapkan dapat dijadikan acuan untuk penelitian selanjutnya dan dapat memberikan informasi mengenai perbedaan kadar hemoglobin terglikasi (HbA1c) pada pasien kusta dan non kusta.
