## 7. Tangki Starter

Asumsi :

- Rumus molekul dari bakteri *Acetobacter xylinum* didekati dengan rumus molekul dari *Pseudomonas* yaitu  $\text{CH}_2\text{O}_{0,52}\text{N}_{0,23}$ . karena *Acetobacter xylinum* merupakan famili dari Pseudomonaceae.
- Suspended solid sebagai sukrosa
- Untuk sumber nitrogen sebagai nutrisi pertumbuhan digunakan urea dahulu karena urea lebih mudah digunakan, daripada protein.
- Protein yang dikonsumsi oleh bakteri adalah 55% dari berat kering *Acetobacter xylinum*.
- Lemak yang dikonsumsi oleh bakteri adalah 12,5% dari berat kering *Acetobacter xylinum*.
- Sellulosa yang terbentuk sangat sedikit sehingga dapat diabaikan dan di tangki ini hanya untuk pengembangbiakan atau pertumbuhan bakteri.
- Biomass terdiri dari berat cell kering ( $\text{CH}_2\text{O}_{0,52}\text{N}_{0,23}$ ).
- $\text{CO}_2$  yang terbentuk dari reaksi terlarut didalam larutan whey (media).
- $\text{CO}_2$  yang keluar ke udara sangat kecil sehingga diabaikan.
- $\text{O}_2$  yang masuk dari kompresor berlebih 20 % dari  $\text{O}_2$  yang dibutuhkan.
- $\text{O}_2$  sisa dari reaksi terlarut didalam larutan whey (media) dan dianggap  $\text{O}_2$  yang keluar ke udara sangat kecil sehingga diabaikan.

### Pengaduk

Tipe : flat six blade turbine with disk

Dari Geankoplis 3<sup>rd</sup>, table 3.4-1,p.144, diperoleh :

$$Da = 0,3 \quad Dt = 2,8203 \text{ ft}$$

$$J/Dt = 1/12, \quad J = 0,7834 \text{ ft}$$

$$Da/W = 5, \quad W = Da/5 = 0,5640 \text{ ft}$$

$$C/Dt = 1/3, \quad C = Dt \times 1/3 = 3,1337 \text{ ft}$$

$$L/Da = 1/4, \quad L = Da \times 1/4 = 0,7050 \text{ ft}$$

Dimana :

$Da$  = diameter pengaduk

Kecepatan agitator antara 20 – 150 ( Mc.Cabe 5<sup>th</sup> ed,p.238) diambil 30 rpm = 0,5rps.

$$N_{re} = \frac{NxDa^2x\rho}{\mu}$$

Asumsi :

$$\mu_{\text{larutan}} = \mu_{\text{air pada } T = 32^\circ\text{C}} = 0,7679 \cdot 10^{-3} \text{ kg/m.s}$$

$$\rho_{\text{larutan}} = \rho_{\text{air pada } T = 32^\circ\text{C}} = 994,994 \text{ kg/m}^3$$

$$N_{re} = \frac{0,5 \times (2,8203)^2 \times 994,994}{0,7679 \cdot 10^{-3}} = 5,153 \cdot 10^6$$

Dari Geankoplis 3<sup>rd</sup>, p.145, fig.3.4-4 diperoleh  $N_p = 5$

Power untuk pengaduk :

$$\begin{aligned}

 &= 1070,0263 \text{ J/s} \\
 &= 1,0710 \text{ hp}
 \end{aligned}$$

$$\text{Power motor yang dipakai} = \frac{1,0710}{0,85} = 1,265 \text{ hp}$$

## 11. Ruang Fermentasi (X-220)

Fungsi : sebagai tempat fermentasi untuk pembentukan *bacterial cellulose* dengan kapasitas untuk 4x proses.

Type : gedung dengan konstruksi beton

Kapasitas : 68277,555 kg/hari

Ruang fermentor dibuat 4x lebih besar dari kapasitas :

$$68277,555 \text{ kg} \times 4 = 272910,22 \text{ kg}$$

Densitas larutan : 1038,1 kg/m<sup>3</sup>

Menghitung jumlah nampan :

$$\text{Volume 1 nampan} = p \times l \times t$$

$$= 1,6 \text{ m} \times 1 \text{ m} \times 0,05 \text{ m}$$

$$= 0,08 \text{ m}^3 = 80.000 \text{ cm}^3$$

nampan diisi larutan sampai ketinggian 3 cm

$$\text{Volume cairan dalam nampan} = p \times l \times t$$

$$= 160 \text{ cm} \times 100 \text{ cm} \times 3 \text{ cm}$$

$$= 48.000 \text{ cm}^3 = 0,048 \text{ m}^3$$

$$\text{Volume larutan total} = \frac{68227,555 \text{ kg}}{1038,1 \text{ kg} / \text{m}^3} = 65,7234 \text{ m}^3$$

$$\text{Jumlah nampan} = \frac{\text{vol.lart total}}{\text{vol.cairan dalam nampan}}$$

$$= \frac{65,7234}{0,048}$$

$$= 1369 \text{ nampan/hari}$$

Menghitung jumlah rak :

Assumsi :

Lebar rak : 100 cm

Tinggi rak : 4 m

Tinggi rongga antar nampan : 5 cm

$$\text{Jumlah lubang yang terdapat dalam rak setinggi } 4 \text{ m} = \frac{\text{tinggirak}}{\text{tingginampan}}$$

Dengan tinggi space antar nampan : 5 cm + 5 cm = 10 cm

$$\text{Jumlah nampan dalam rak setinggi } 4 \text{ m} : \frac{400\text{cm}}{10\text{cm}} = 40 \text{ nampan}$$

Panjang tempat nampan ( 1 rak ) = 100 cm + 10 cm = 110 cm

$$\text{Untuk 1 kali proses fermentasi memerlukan} = \frac{1369}{40} = 34 \text{ rak}$$

Dalam ruang fermentor terdapat  $34 \text{ rak} \times 4 = 136 \text{ rak}$

Untuk sisi panjang fermentor terdapat susunan 17 rak

Untuk sisi lebar fermentor terdapat susunan 8 rak

Tinggi ruang fermentasi = tinggi rak + 100 cm = 400 cm + 100 cm = 500 cm

Panjang ruang fermentasi = panjang rak + lebar jalan

$$= (17 \text{ rak} \times 110 \text{ cm}) + (1 \text{ m} \times 16 \text{ ruas}) + 4 \text{ m}$$

$$= 39 \text{ m} = 40 \text{ m}$$

lebar ruang fermentasi = ( lebar rak x jumlah rak ) + ( lebar jalan )

$$\begin{aligned}
 &= (1 \text{ m} \times 8 \text{ rak}) + (1 \text{ m} \times 7 \text{ ruas}) + 4 \text{ m} \\
 &= 19 \text{ m} = 20 \text{ m}

Fungsi : untuk mengangkut *bacterial cellulose* menuju ke bleaching unit

dan sebagai tempat untuk mencuci *bacterial cellulose*

Bahan : Stainless stell dan rubber

Kapasitas: 15505,6136 kg/hari (dalam 1 hari belt conveyor beroperasi

selama 2 jam )

$$15505,6136 \text{ kg/jam} \times 1 \text{ hari}/2 \text{ jam} = 7752,8068 \text{ kg/jam}$$

Dari Perry ed 7,table 21-7,p.21-11 dipilih untuk lebar belt 105 cm

Kecepatan belt : 30,6 m/menit

Kapasitas : 330 ton/jam

Hp/10ft – lift : 3,5 Hp

Hp/100ft – center : 2,28 Hp

Tripper : 9,5 Hp

$$\text{Kecepatan belt} = \frac{7752,8068 \text{ kg / jam}}{330000 \text{ kg / jam}} \times 30,5 \text{ m/menit} = 0,7165 \text{ m/menit}$$

Menentukan Power :

a. Hp untuk 100 ft =  $\frac{7752,8068 \text{ kg / jam}}{330.000 \text{ kg / jam}} \times 2,28 \text{ Hp} = 0,05356 \text{ Hp}$

b. Hp untuk =  $\frac{10m \cdot 3,2808 \text{ ft / m}}{100 \text{ ft}} \times 0,05356 \text{ Hp} = 0,0175 \text{ Hp}$

c. Power untuk halangan /saandungan / tripper :

Untuk kecepatan belt : 0,7165 m/menit maka power tripper

$$\frac{0,7165 \text{ m / menit}}{30,5 \text{ m / menit}} \times 9,5 \text{ Hp} = 0,2231 \text{ Hp}$$

Total power = 0,0175 Hp + 0,2231 Hp = 0,2406 Hp

Efisiensi = 80% (Peter&Timerhause,fig.14.38, p. 521)

$$\text{Power yang dibutuhkan} = \frac{0,2406 \text{ Hp}}{0,8} = 0,3 \text{ Hp}$$

### **PERHITUNGAN ANALISA EKONOMI**

**APPENDIX D**  
**PERHITUNGAN ANALISA EKONOMI**

Penafsiran harga peralatan perlu dilakukan karena harga alat dapat berubah setiap waktunya. Oleh karena itu digunakan index harga supaya dapat mengkonversikan harga dimasa yang sekarang dengan sebelumnya sehingga diperoleh harga alat yang ekivalen.

Ekivalensi itu dapat dihitung berdasarkan persamaan :

$$\text{Harga alat saat ini} = \frac{\text{indeks harga saat ini}}{\text{index harga tahun } X} \times \text{harga alat tahun } X$$

Dalam perhitungan ini digunakan indeks harga sebagai berikut :

Data – data cost indeks tahun 1998 – 2002

Tahun	CE Cost Index
1998	389,5
1999	390,6
2000	394,1
2001	394,3
2002	395,6

Sumber : *Chemical Engineering, januari 2002*

Dari data – data diatas dengan cara ekstrapolasi dari linierisasi data – data sebelumnya diperoleh cost index untuk tahun 2007 = 401,95

#### A. Perhitungan Harga Peralatan

Contoh perhitungan :

Nama alat : Tangki Whey ( F-110 )

Kapasitas : 23,895 m<sup>3</sup>

Harga untuk tahun 2002 = harga tangki = \$ 7.450

$$\text{Harga untuk tahun 2007} = \frac{395,6}{401,95} \times \$ 7.450 = \$ 7.570$$

Diambil : \$ 1 = Rp. 9.500,-

Assumsi harga tahun 2002 ≈ harga tahun 2007

Sehingga didapatkan harga tangki whey = Rp. 71.911.050,-

Dengan cara yang sama, dapat diketahui harga tiap peralatan sebagai berikut :

Luar waktu beban puncak = Rp. 382/kVA

Dalam satu hari 4 jam WBP dan 20 jam LBWP

$$\begin{aligned} \text{Biaya listrik/tahun} &= \{(4 \text{ jam} \times 127,47 \text{ kVA} \times \text{Rp.} 534,8/\text{kVA}) + (20 \text{ jam} \times \\ &\quad 127,47 \text{ kVA} \times \text{Rp.} 382/\text{kVA})\} \times 300 \text{ hari/tahun} \\ &= \text{Rp.} 373.966.387,- \end{aligned}$$

biaya total/tahun = biaya listrik + biaya beban

$$= \text{Rp.} 373.966.387,- + \text{Rp.} 36.711.360,-$$

$$= \text{Rp.} 410.677.747,-$$

#### 2. Kebutuhan Bahan Bakar

Kebutuhan bahan bakar = 3482,99 lt/bulan

Harga bahan bakar = 2.500/lt

Biaya bahan bakar = Rp. 2.500/lt x 3482,99 lt/bulan

$$= \text{Rp.} 8.707.469/\text{bulan} \times 12 \text{ bulan} = \text{Rp.} 104.489.633,-$$

### 3. Kebutuhan Air

Kebutuhan air = 504 m<sup>3</sup>/hari = 15120 m<sup>3</sup>/bulan

Biaya air :

Rp. 3.700,- untuk penggunaan 1 – 10 m<sup>3</sup>

Rp. 5.700,- untuk penggunaan 11 – 12 m<sup>3</sup>

Rp. 6.900,- untuk penggunaan 20 m<sup>3</sup> keatas

Biaya air = ( Rp. 3.700 x 10 m<sup>3</sup> ) + ( Rp. 5.700 x 10 m<sup>3</sup> ) +

( Rp. 6.900 x 15080 m<sup>3</sup> )

$$= \text{Rp.} 1.251.408.000,-$$
